ABSTRACT

Objectives: To assess the compliance of statin treatment in hyperlipidemic patients and its association with Socioeconomic Status in Nawabshah, Sindh, Pakistan.
Methodology: This was a retrospective cross-sectional study using convenient sampling technique conducted in collaboration with Department of Cardiology & Medicine People Medical College Hospital (PMCH) Nawabshah, Sindh, Pakistan during January to June 2015. A total of 100 patients suffering from Hyperlipidemia (diagnosed) were recruited from out patients department (OPD) of Cardiology & Medicine department. The data was collected by administering the questionnaire to Hyperlipidemic patients after a written consent. All the variables related to socioeconomically class on per designed questionnaire were registered by filling the designed Proforma.

Results: Out of 100 patients enrolled the mean age of the patients was 49.45± 9.72 years. The mean cholesterol levels were 231.83± 15.9 mg/dl. Statin therapy compliance was compared with socioeconomic status. Statin therapy compliance was achieved in socioeconomic status which revealed > 80% proportion of days covered (PDC) response however results statistical significance was P-value 0.056.

Conclusion: Hyperlipidemic patients have shown a good compliance to statins. Compliance in both lower and middle class was more than in higher class.

Keywords: Compliance; hyperlipidemia; nawabshah; statin.

1. INTRODUCTION

Patient’s adherence with treatment can be strongly predicted through the stability amid requirements for medication & interests over their usage. The reason of the poor conformity and therapy for asymptomatic long-term condition like dyslipidemia is the demonstration of this opinion of the comparative benefits and risk of treatment. Patients could consequently have decreased compliance with long term management and may not distinguish any benefit of therapy, because there are no clear signs of dyslipidemia [1-5]. Patients treated for primary prevention have lesser acceptance to statin therapy than patients with clear sign of CHD like new ACS i-e; acute coronary syndrome due the better awareness of the need for treatment. Aware patients with increased CHD risk like diabetes or hypertension explain greater conformity rates with lipid lowering medication. The consequences of CHD usually occur with increasing age since it is associated with increasing age. Unaware patients of long term management stop taking their medication and may consider themselves cured on treatment is applied and cholesterol reduced to be suggested level. On other hand, this information may be taken out of context and information sources may not necessarily be precise. Patients’ poor info decisions make them non-compliant. As a result, the contribution to the more compliant behavior is due to the more risk awareness of CHD and aids of treatment [6-10].

The aim of this study is to assess the compliance of statin treatment in hyperlipidemic patients and its association with Socioeconomic Status Nawabshah, Sindh, Pakistan.

2. METHODOLOGY

This was a retrospective cross-sectional study using convenient sampling technique conducted in collaboration with Department of Cardiology & Medicine People Medical College Hospital (PMCH) Nawabshah, Sindh, Pakistan during January to June 2015. A total of 100 patients suffering from Hyperlipidemia (diagnosed) were recruited from out patients department (OPD) of Cardiology & Medicine department. The data was collected by administering the questionnaire to Hyperlipidemic patients after a written consent. All the variables related to socioeconomically class on per designed questionnaire were registered by filling the designed Proforma.

2.1 Inclusion Criteria

The following patients were included in this study:

- Both genders.
- Age 30 years and above.
- The diagnosed cases/patients of Hyperlipidemia.
- Mild (160-200mg/dl) to moderate (200-290mg/dl) Hyperlipidemic patients were recruited; complicated cases were not taken because complications have developed.

Table 1. Brief schedule of Patient’s visit

<table>
<thead>
<tr>
<th>Visit</th>
<th>First Base Line</th>
<th>Second</th>
<th>Third</th>
<th>Fourth</th>
<th>Fifth</th>
<th>Sixth</th>
<th>Seventh</th>

</thead>
<tbody>
<tr>
<td>Day</td>
<td>01st</td>
<td>15th</td>
<td>30th</td>
<td>45th</td>
<td>60th</td>
<td>75th</td>
<td>90th</td>
</tr>
</tbody>
</table>
2.2 Exclusion Criteria

- Following patients were excluded from the study.
- Sever Hyperlipidemic patents
- Patients with acute Myocardial Infarction.
- Patients below the age of 30 yrs were not included in the study.
- Co morbidities like diabetes, heart failure, hepatic disease, renal impairment.

The patients have to complete seven visits as per schedule given as under in Table 1. The first visit was counted as is baseline on day 1\textsuperscript{st}, the second visit was on day 15\textsuperscript{th}, third visit was scheduled on day 30\textsuperscript{th}, fourth on day 45\textsuperscript{th}, fifth on day 60\textsuperscript{th}, sixth on day 75\textsuperscript{th} day, and last 7\textsuperscript{th} visit of each patient were on day 90\textsuperscript{th} of the study.

The portion of the designed Performa was filled on every visit for each patient. Marked empty blisters of tablets were collected back from the patients on every visit also follow Morisky scale to check the compliance [11].

2.3 Data Analysis

After completion of the study, the data was computed. Finally, data was evaluated by using statistical software SPSS, IBM to check the significance of the results. Compliance to the statin related to socio economic class was calculated and appropriate test were applied in data analysis.

3. RESULTS

Out of 100 patients enrolled the mean age of the patients was 49.45± 9.72 years. The average among males and females was nearly same. The mean cholesterol levels were 231.83± 15.9 mg/dl (Table 2). Age range of 31 to 50 years was reported in 44 (44%) patients and 51 to 70 years was 56 (56%) (Fig. 1).

### Table 2. Statistics of demographic variables

<table>
<thead>
<tr>
<th>Variables</th>
<th>Frequency (percentages)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gender</td>
<td>Male: female 54 (54%) : 46 (46%)</td>
</tr>
<tr>
<td>Age in years</td>
<td>49.45± 9.72</td>
</tr>
<tr>
<td>Cholesterol in mg/dl</td>
<td>231.83± 15.9</td>
</tr>
<tr>
<td>Mean ±SD</td>
<td>14 (14%)</td>
</tr>
</tbody>
</table>

The cholesterol levels of mild to moderate levels were divided into three ranges one from 201-220 mg/dl affecting n=25(25%) individuals, other 221-240 mg/dl in n= 61(61%), 241-260 mg/dl in n= 14(14%) (Fig. 3). The range between 221-240 mg/dl was higher compared to levels from 201-220 mg/dl and much lower levels from 241-260 mg/dl.

*proportion of days covered

![Bar Chart]

Fig. 5. Graphical presentation of Statin compliance association with socioeconomic status

The socioeconomic group was divided into three on the basis of monthly income i.e.; lower class with monthly income of less than 10,000 rupees, middle class with monthly income between range of 10,000 to 50,000 rupees and higher class is considered those having above 50,000.

The lower class affected was n= 40(40%), middle class in n= 43(43%), and higher class in n= 17(17%). (Fig. 4).

Both the groups the statin therapy compliance was compared with socioeconomic status. Statin therapy compliance was achieved in both age groups revealing no statistical significance after comparison of socioeconomic status with statin therapy, however all groups lower, middle and higher class have shown proportion of days covered (PDC) > 80% with slightly lower compliance seen in lower class probably due to non-affordability. (p value=0.056) (Table 3).

4. DISCUSSION

The mortality is declining in patients with coronary heart diseases due to strategies involving risk reduction which has been achieved by statin use. The mortality benefits from Myocardial Infarction seen after statin therapy has also been reduced from 21% to 7%. Despite this usefulness, non-compliance is a significant risk that poses the individual to suffer from preventable cause. Compliance has been shown to be reduced in Chinese and Asians [12].

A study carried out by Qamaral-Haq, showed increased incidence among higher socioeconomic people of younger age are more affected. Also found increased compliance in patients with comorbidities like hypertension and dyslipidemia. He in his research conducted that 150 patients responded to diet and regular exercise and that restriction of diet reduced significantly lipids in hyperlipidemic patients [13].

In our study comparison between two groups like the patients with hyperlipidemia with socioeconomic status showed that no statistical significance was revealed after socioeconomic status with hyperlipidemia however little higher incidence was seen in middle aged individuals.
In our study both the groups i.e.; the statin therapy compliance was compared with socioeconomic status. Statin therapy compliance no statistical significance was revealed after socioeconomic status with statin therapy, however all groups lower, middle and higher class have shown PDC > 80% with slightly lower compliance seen in lower class probably due to non-affordability.

Therefor it is necessary that patients whether symptomatic or having asymptomatic hyperlipidemias should have strict dietary control as well as strict compliance and adherence of antihyperlipidemic medications. Not only this but also the control of comorbidities like strict glycemic control in diabetes mellitus, hypertension, and all other modifiable factors like quit smoking or alcohol abuse, control of obesity by modifying lifestyles is important in order to achieve desired goal and help decrease morbidity and mortality due to complications of hyperlipidemia.

5. CONCLUSION

Hyperlipidemic patients have shown a good compliance to statins. Compliance in both lower and middle class was more than in higher class.

ETHICAL APPROVAL

This study was approved by ethical review committee of People’s University of Medical and Health Sciences for Women Nawabshah, Sindh, Pakistan.

CONSENT

As per international standard or university standard, patients’ written consent has been collected and preserved by the author(s).

COMPETING INTERESTS

Authors have declared that no competing interests exist.
